THERAPEUTIC AGENTS

The present invention relates to a class of indole-substituted triazole and tetrazole derivatives which act on 5-hydroxytryptamine (5-HT) receptors, being selective agonists of so-called "5-HT<sub>1</sub>-like" receptors. They are therefore useful in the treatment of clinical conditions for which a selective agonist of these receptors is indicated.

5-HT<sub>1</sub>-like receptor agonists which exhibit selective vasoconstrictor activity have recently been described as being of use in the treatment of migraine (see, for example, A. Doenicke *et al.*, The Lancet, 1988, Vol. 1, 1309-11). The compounds of the present invention, being selective 5-HT<sub>1</sub>-like receptor agonists, are accordingly of particular use in the treatment of migraine and associated conditions, e.g. cluster headache, chronic paroxysmal hemicrania and headache associated with vascular disorders.

EP-A-0313397 describes a class of tryptamine derivatives substituted by a five-membered heteroaliphatic ring, which are stated to be specific to a particular type of "5-HT<sub>1</sub>-like" receptor and thus to be effective therapeutic agents for the treatment of clinical conditions, particularly migraine, requiring this activity. However, EP-A-0313397 neither discloses nor suggests the triazole and tetrazole derivatives provided by the present invention.

The present invention provides a compound of formula I, or a salt or prodrug thereof:

A<sup>2</sup> represents a non-bonded electron pair when

Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may include alkali metal salts, e.g. sodium or potassium salts; alkaline earth metal salts, e.g. calcium or magnesium salts; and salts formed with suitable organic ligands, e.g. quaternary ammonium salts.

The invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, or suppositories, for oral, parenteral or rectal administration. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in

the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of  
5 polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated  
10 for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical  
15 vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

20 In the treatment of migraine, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day.

25 The 1,2,4-triazole compounds of this invention may be prepared by a process which comprises reacting a reactive derivative of a carboxylic acid of formula  $R^a\text{-CO}_2\text{H}$  with a compound either of formula III or of formula IV, or a salt thereof:

10 wherein one of  $\text{R}^a$ ,  $\text{R}^b$  and  $\text{R}^c$  is a group of formula  $\text{A}^1$ ,  
 another is a group of formula  $\text{A}^2$ , and the third is a  
 group of formula  $-\text{E}-\text{F}$ , as defined with reference to  
 formula I above.

15 Suitable reactive derivatives of the acid  
 $\text{R}^a-\text{CO}_2\text{H}$  include esters, for example  $\text{C}_1-4$  alkyl esters;  
 thioesters, for example pyridylthioesters; acid  
 anhydrides, for example  $(\text{R}^a-\text{CO})_2\text{O}$ ; acid halides, for  
 example acid chlorides; orthoesters; and primary,  
 secondary and tertiary amides.

20 A preferred reactive derivative of the acid  
 $\text{R}^a-\text{CO}_2\text{H}$  is the iminoether derivative of formula V:

where R is  $\text{C}_1-4$  alkyl.

30 The reaction is conveniently carried out by  
 heating the reagents together, optionally in a solvent,  
 for example tetrahydrofuran, dimethylformamide or a lower  
 alkanol such as ethanol, propanol or isopropanol, at  
 about  $20^\circ\text{C}$  to  $100^\circ\text{C}$  for about 1 to 6 hours.

Where  $R^a$  is a group of formula -E-F and the group F is an indole moiety of structure FC as defined above, the reactive derivative of a carboxylic acid of formula  $HO_2C-E-F$  may be prepared by reacting a compound of formula VI:

(VI)

wherein Q represents a reactive carboxylate moiety, and E is as defined above; with a compound of formula VII or a carbonyl-protected form thereof:

(VII)

wherein  $R^2$  is as defined above and  $R^{11}$  corresponds to the group  $R^1$  as defined above or represents a group of formula  $-CH_2.CHR^4D^1$ , in which  $R^4$  is as defined above and  $D^1$  represents a readily displaceable group; followed, where required, by N-alkylation by standard methods to introduce the moiety  $R^3$ .

Suitable carbonyl-protected forms of the compounds of formula VII include the dimethyl acetal or ketal derivatives.

The readily displaceable group  $D^1$  in the compounds of formula VII suitably represents a halogen group, preferably chlorine. When the moiety  $R^{11}$  in the compounds of formula VII is a group of formula

-CH<sub>2</sub>.CHR<sup>4</sup>D<sup>1</sup>, the substituent D<sup>1</sup> is displaced in situ under the prevailing reaction conditions to afford a final product of formula I wherein R<sup>1</sup> represents a group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NH<sub>2</sub>. The terminal amino group can subsequently, if desired, be further elaborated using techniques known from the art to give a compound of formula I wherein R<sup>1</sup> represents the required group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NR<sup>6</sup>R<sup>7</sup>.

The reaction of compounds VI and VII may be carried out in a single step (Fischer indole synthesis) or by an initial non-cyclising step at a lower temperature to give a compound of formula VIII:

(VIII)

wherein Q, E, R<sup>2</sup> and R<sup>11</sup> are as defined above; followed by cyclisation using a suitable reagent, such as a polyphosphate ester, to give a compound of formula Q-E-F.

The hydrazines of formula VI may be prepared from the corresponding anilines of formula IX:

(IX)

wherein Q and E are as defined above; by diazotisation followed by reduction. Diazotisation is typically

carried out using sodium nitrite/conc. HCl and the resulting diazo product reduced in situ using, for example, tin(II) chloride/conc. HCl.

5 The anilines of formula IX may be prepared by reduction of the corresponding nitro compounds of formula X:

(X)

15 wherein Q and E are as defined above; typically by catalytic hydrogenation or using tin(II) chloride.

Where they are not commercially available, the nitro compounds of formula X may be synthesized by standard methods well known to those skilled in the art.

20 Where  $R^a$  is a group of formula -E-F and the group F is an indazole moiety of structure FB as defined above, the reactive derivative of a carboxylic acid of formula  $HO_2C-E-F$  may be prepared by the cyclisation of a compound of formula XI:

(XI)

wherein Q, E and  $R^1$  are as defined above; and  $D^2$  represents a readily displaceable group; followed, where

required, by N-alkylation by standard methods to introduce the moiety  $R^3$ .

The cyclisation of compound XI is conveniently achieved in a suitable organic solvent at an elevated temperature, for example in a mixture of m-xylene and 2,6-lutidine at a temperature in the region of 140°C.

The readily displaceable group  $D^2$  in the compounds of formula XI suitably represents a  $C_{1-4}$  alkanoyloxy group, preferably acetoxy. Where  $D^2$  in the desired compound of formula XI represents acetoxy, this compound may be conveniently prepared by treating a carbonyl compound of formula XII:

(XII)

wherein  $R^1$ , E and Q are as defined above; or a protected derivative thereof; with hydroxylamine hydrochloride, advantageously in pyridine at the reflux temperature of the solvent; followed by acetylation with acetic anhydride, advantageously in the presence of a catalytic quantity of 4-dimethylaminopyridine, in dichloromethane at room temperature.

The N-formyl protected derivative of the intermediate of formula XII may be conveniently prepared by ozonolysis of an indole derivative of formula XIII:

(XIII)

wherein  $R^1$ , E and Q are as defined above; followed by a reductive work-up, advantageously using dimethylsulphide.

10

The indole derivative of formula XIII may be prepared by methods analogous to those described in the accompanying Examples, or by procedures well known from the art.

15

In an alternative process, the triazole compounds according to the invention may be prepared by a method which comprises reacting a compound of formula XIV:

(XIV)

wherein  $A^1$ , E and F are as defined above, Hal represents halogen, and two of  $V^a$ ,  $W^a$ ,  $X^a$ ,  $Y^a$  and  $Z^a$ , to one of which the group Hal is attached, represent carbon and the remainder represent nitrogen; with a reagent which provides an anion  $A^{2-}$ , where  $A^2$  is as previously defined.

30

Reagents which may provide the anion  $A^{2-}$  include Grignard reagents  $A^2MgHal$  (where Hal = halogen); organocuprate reagents such as  $LiA^2_2Cu$ ; organolithium

reagents  $A^2Li$ ; or compounds which stabilise the anion by means of an adjacent activating group such as an ester or enolisable ketone function. In this case, the adjacent ester or ketone function may be retained after the process is complete, or may be removed. For example, an ester moiety may be hydrolysed and decarboxylated.

The 1,2,3-triazole compounds according to the present invention may be prepared by a process which comprises the cycloaddition of an alkyne of formula  $R^a-C\equiv C-R^b$  with an azide of formula  $R^c-N_3$ , where  $R^a$ ,  $R^b$  and  $R^c$  are as defined above.

The cycloaddition reaction may be conveniently effected in a suitable solvent such as tetrahydrofuran, ideally by heating in an autoclave for 8 hours.

The tetrazole compounds in accordance with the invention may be prepared by a process which comprises the cycloaddition of a nitrile of formula  $N\equiv C-R^d$  with an azide of formula  $R^e-N_3$ , where one of  $R^d$  and  $R^e$  represents a group of formula  $A^1$  and the other is a group of formula  $-E-F$ , as defined previously.

The cycloaddition reaction is conveniently effected by heating the reactants together at an elevated temperature, e.g. a temperature in the region of  $150^\circ C$ , in a suitable solvent such as N-methylpyrrolid-2-one, advantageously in the presence of triethylamine hydrochloride. The product obtained from the cycloaddition reaction will generally be a mixture of isomers substituted by the  $A^1$  group at positions 1 and 2 of the tetrazole ring, corresponding to structures IL and IM respectively as defined above. These isomers may conveniently be separated using conventional techniques such as chromatography.

In an alternative process, the tetrazole compounds of the invention may be prepared by a method

which comprises reacting a compound of formula  $R^e-L$  with a tetrazole derivative of formula XV:

(XV)

wherein one of  $R^d$  and  $R^e$  represents a group of formula  $A^1$  and the other is a group of formula  $-E-F$ , as defined above, and  $L$  represents a suitable leaving group; in the presence of a base such as triethylamine.

15           The leaving group  $L$  suitably represents halogen, e.g. bromine or iodine, or a sulphonate derivative such as tosylate or mesylate.

          The reaction is conveniently carried out in a suitable organic solvent, e.g. acetonitrile, at room  
20           temperature.

          The tetrazole derivatives of formula XV may be prepared by cycloaddition of a nitrile of formula  $N\equiv C-R^d$  with sodium azide, advantageously under the conditions described above for the reaction between the nitrile  
25            $N\equiv C-R^d$  and the azide  $R^e-N_3$ ; followed by acidification with a mineral acid such as hydrochloric acid.

          In a further process, the compounds according to the invention may be prepared by a method which comprises reacting a compound of formula XVI:

(XVI)

wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup> and E are as defined above;  
 10 with a compound of formula VII as defined above, or a  
 carbonyl-protected form thereof, e.g. the dimethyl acetal  
 or ketal; followed, where required, by N-alkylation by  
 standard methods to introduce the moiety R<sup>3</sup>.

As with that between compounds VI and VII, the  
 15 reaction between compounds XVI and VII may be carried out  
 in a single step (Fischer indole synthesis) or by an  
 initial non-cyclising step at a lower temperature to give  
 a compound of formula XVII:

(XVII)

30 wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup>, E, R<sup>2</sup> and R<sup>11</sup> are as  
 defined above; followed by cyclisation using a suitable  
 reagent, e.g. a polyphosphate ester.

The hydrazines of formula XVI may be prepared  
 from the corresponding anilines of formula XVIII:

(XVIII)

wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup> and E are as defined above;  
 10 by methods analogous to those described above with  
 reference to the compounds of formula IX.

The anilines of formula XVIII may be prepared  
 from those of formula IX above by appropriate  
 modification of the moiety Q using, for example, methods  
 15 analogous to those described above with reference to the  
 compounds of formulae III and IV. Thus, for example,  
 since Q in the compounds of formula IX represents a  
 reactive carboxylate moiety, the compounds of formula  
 XVIII may be prepared therefrom by reaction with a  
 20 compound of formula A<sup>2</sup>-C(=NNHA<sup>1</sup>)NH<sub>2</sub> or A<sup>2</sup>-C(=NNH<sub>2</sub>)NHA<sup>1</sup>.

In a still further process, the compounds  
 according to the invention may be prepared by a method  
 which comprises cyclising a compound of formula XIX:

(XIX)

wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup>, E, R<sup>1</sup> and D<sup>2</sup> are as  
 defined above; followed, where required, by N-alkylation  
 by standard methods to introduce the moiety R<sup>3</sup>.

As with the cyclisation of compound XI, that of compound XIX is conveniently achieved in a suitable organic solvent at an elevated temperature, for example in a mixture of m-xylene and 2,6-lutidine at a temperature in the region of 140°C.

The compounds of formula XIX may, for example, be prepared from the corresponding compound of formula XX:

(XX)

wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup>, E and R<sup>1</sup> are as defined above; or a protected derivative thereof; which in turn may be prepared from the corresponding compound of formula XXI:

(XXI)

wherein V, W, X, Y, Z, A<sup>1</sup>, A<sup>2</sup>, E and R<sup>1</sup> are as defined above; using methods analogous to those described above with reference to the compounds of formulae XII and XIII. Thus, for example, since Q in the compounds of formula  
5 XIII represents a reactive carboxylate moiety, the compounds of formula XXI may be prepared therefrom by reaction with a compound of formula A<sup>2</sup>-C(=NNHA<sup>1</sup>)NH<sub>2</sub> or A<sup>2</sup>-C(=NNH<sub>2</sub>)NHA<sup>1</sup>.

It will be understood that any compound of  
10 formula I initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further compound of formula I by techniques known from the art. Indeed, as will be appreciated, the compound of formula XV above is itself a  
15 compound of formula I in which A<sup>1</sup> is hydrogen and A<sup>2</sup> represents a non-bonded electron pair. In particular, a compound of formula I wherein R<sup>3</sup> is hydrogen initially obtained may be converted into a compound of formula I wherein R<sup>3</sup> represents C<sub>1-6</sub> alkyl, C<sub>2-6</sub> alkenyl or C<sub>2-6</sub>  
20 alkynyl by standard techniques such as alkylation, for example by treatment with an alkyl iodide, e.g. methyl iodide, typically under basic conditions, e.g. sodium hydride in dimethylformamide, or triethylamine in acetonitrile. Similarly, a compound of formula I wherein  
25 R<sup>1</sup> represents a group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NH<sub>2</sub> initially obtained may be converted into a compound of formula I wherein R<sup>1</sup> represents a group of formula -CH<sub>2</sub>.CHR<sup>4</sup>.NR<sup>6</sup>R<sup>7</sup> in which R<sup>6</sup> and R<sup>7</sup> are as defined above with the exception of hydrogen, for example by conventional N-  
30 alkylation or N-arylation techniques, e.g. by treatment with the appropriate aldehyde in the presence of a reducing agent such as sodium cyanoborohydride.

Where the above-described processes for the preparation of the compounds according to the invention

give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography.

5 The novel compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The novel compounds may, for example, be resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with  
10 an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-l-tartaric acid followed by fractional crystallization and regeneration of the free base. The novel compounds may also be resolved by formation of diastereomeric esters or amides,  
15 followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This  
20 may be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, 1981. The protecting groups may be  
25 removed at a convenient subsequent stage using methods known from the art.

Alternatively, certain of the functional groups on the desired products may be carried through the reaction sequence as precursor groups, and then  
30 regenerated from these precursor groups at a late stage in the overall synthesis. For example, where  $R^1$  in the desired compound of formula I represents a group of formula  $-(CH_2)_2NH_2$ , this group can be generated from a cyano precursor  $-CH_2CN$  by reduction using, for example,

borane/tetrahydrofuran. The cyano precursor may in turn be carried through the reaction sequence as a methyl group  $-CH_3$ , which may conveniently be converted to  $-CH_2CN$  by treatment with N-bromosuccinimide and benzoyl peroxide, in the presence of a bright light source, followed by reaction of the resulting bromo intermediate with sodium cyanide in dimethyl sulphoxide.

The following Examples illustrate the preparation of compounds according to the invention.

The ability of test compounds to bind to 5-HT<sub>1</sub>-like receptors was measured in membranes prepared from pig caudate using the procedure described in J. Neurosci., 1987, 7, 894. Binding was determined using 2 nM 5-hydroxytryptamine creatinine sulphate, 5-[1,2-<sup>3</sup>H(N)] as a radioligand. Cyanopindolol (100 nM) and mesulergine (100 nM) were included in the assay to block out 5-HT<sub>1A</sub> and 5-HT<sub>1C</sub> binding sites respectively. The concentration of the compounds of the accompanying Examples required to displace 50% of the specific binding (IC<sub>50</sub>) is below 1  $\mu$ M in each case.

The activity of test compounds as agonists of the 5-HT<sub>1</sub>-like receptor was measured in terms of their ability to mediate contraction of the saphenous vein of New Zealand White rabbits, using the procedure described in Arch. Pharm., 1990, 342, 111. Agonist potencies were calculated as  $-\log_{10}EC_{50}$  (pEC<sub>50</sub>) values, from plots of percentage 5-HT (1  $\mu$ M) response against the concentration of the agonist. The compounds of the accompanying Examples were found to possess pEC<sub>50</sub> values in this assay of not less than 5.0 in each case.

EXAMPLE 11

20            3-(2-Aminoethyl)-5-(2-methyl-tetrazol-5-yl)benzo[b]thiophene. Oxalate.

Step 1

25            4-Bromophenylmercaptopropanone

To a stirred solution of 4-bromothiophenol (5.09g, 26.9mmol) in NaOH (1.08g, 26.9mmol) and water (32ml) was added chloroacetone (2.17ml, 27.3mmol) and the mixture was stirred under nitrogen for 45min before extracting with ether, washing with water, drying ( $\text{Na}_2\text{SO}_4$ ) and evaporating *in vacuo*, leaving 6.89g (100%) of the title compound as a white solid,  $\delta$  ( $\text{CDCl}_3$ ) 2.27 (3H, s), 3.65 (2H, s), 7.20 (2H, d,  $J = 8.5\text{Hz}$ ), 7.41 (2H, d,  $J = 8.5\text{Hz}$ ).

Step 2

5-Bromo-3-methyl benzo[b]thiophene

To a gently refluxing mixture of polyphosphoric acid (4.47g) and chlorobenzene (100ml) was added 4-bromophenylmercaptopropanone (2.24g, 9.14mmol) portionwise over 1h and the mixture was heated at reflux for 8 days. After cooling the organic phase was decanted off and the residue was decomposed with  $\text{H}_2\text{O}$  (~100ml), extracted with  $\text{CH}_2\text{Cl}_2$  (2 x 75ml), dried ( $\text{MgSO}_4$ ) and combined with the decanted organic phase. This was evaporated *in vacuo* to leave 2.096g of brown oil. Distillation on a Kugelrohr apparatus yielded 1.83g (88%) of the title compound as a pale yellow liquid, bp 100-110°C/0.35mbar.  $\delta$  ( $\text{CDCl}_3$ ) 2.41 (3H, s), 7.10 (1H, s), 7.43 (1H, dd,  $J = 8.5$  and  $1.9\text{Hz}$ ), 7.69 (1H, d,  $J = 8.5\text{Hz}$ ), 7.64 (1H, d,  $J = 1.9\text{Hz}$ ).

Step 35-Cyano-3-methyl benzo[b]thiophene

5 To copper (I) cyanide (0.569g, 6.35mmol) was added 5-bromo-3-methyl benzo[b]thiophene (1.179g, 5.19mmol) in N-methylpyrrolidinone (10ml) and the mixture was stirred at 180-190°C for 17h. This was then partitioned between ether (75ml) and ammonia solution (75ml). The ether layer was separated,  
10 washed with more ammonia solution (2 x 50ml), dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated *in vacuo* to leave 0.81g of an off-white solid. Chromatography on flash silica, eluting with 10% ethyl acetate/petroleum ether yielded 0.76g (85%) of the title compound as a white solid.  $\delta$  (CDCl<sub>3</sub>) 2.47 (3H, s), 7.23 (1H, s),  
15 7.55 (1H, dd, J = 8.3 and 1.5Hz), 7.93 (1H, d, J = 8.4Hz), 8.03 (1H, d, J = 1.4Hz).

Step 43-Methyl-5-(tetrazol-5-yl)-benzo[b]thiophene

20 To a solution of 5-cyano-3-methyl benzo[b]thiophene (0.194g, 1.12mmol) in N-methylpyrrolidinone (5ml) under nitrogen was added triethylamine hydrochloride (0.231g, 1.68mmol) followed by sodium azide (0.234g, 3.59mmol) and the  
25 mixture was extracted with ether (4 x 50ml). The combined ether extracts were dried (Mg SO<sub>4</sub>) and evaporated *in vacuo* to

leave 0.78g of a white solid. This was chromatographed on flash silica, eluting with  $\text{CH}_2\text{Cl}_2/\text{MeOH}/\text{NH}_3(\text{aq})$  (40:8:1 to 30:8:1), to give 0.246g (100%) of the title product as a white solid.  $\delta$  (DMSO) 2.46 (3H, s), 7.41 (1H, s), 7.98 (1H, d,  $J = 8.4\text{Hz}$ ), 8.03 (1H, dd,  $J = 8.4$  and  $1.5\text{Hz}$ ), 8.36 (1H, d,  $J = 0.9\text{Hz}$ ).  $m/z$  ( $\text{Cl}^-$ ,  $\text{NH}_3$ ) 215 ( $\text{M-H}^-$ ), 160.

### Step 5

3-Methyl-5-(2-methyltetrazol-5-yl)benzo[b]thiophene and 3-Methyl-5-(1-methyltetrazol-5-yl) benzo[b]thiophene

To a mixture of 3-Methyl-5-(tetrazol-5-yl) benzo[b]thiophene (0.241g, 1.12mmol) in acetonitrile (5ml) was added triethylamine (0.28ml, 2.01mmol), then iodomethane (0.486ml, 7.81mmol) followed by DMF (3ml) until a clear solution formed. The solution was stirred overnight under nitrogen before evaporating *in vacuo* and partitioning the residue between water (50ml) and ether (25ml). The aqueous layer was separated and extracted with more ether (2 x 25ml), the combined ether extracts were dried ( $\text{Mg SO}_4$ ) and evaporated *in vacuo* to leave 0.241g of yellow solid. Chromatography on flash silica, eluting with 25-40% ethyl acetate/petroleum ether gave 0.168g (65%) of the 2-isomer of the title product as a white solid and 0.063g (24%) of the 1-isomer of the title product as a white solid. 2-isomer  $\delta$  ( $\text{CDCl}_3$ ) 2.52 (3H, s), 4.42 (3H, s), 7.14 (1H, s), 7.94 (1H, d,  $J = 8.4\text{Hz}$ ), 8.10 (1H, dd,

$J = 8.4$  and  $1.5\text{Hz}$ ),  $8.51$  (1H, s).  $m/z$  ( $\text{CI}^+, \text{NH}_3$ )  $231$  ( $\text{M}+\text{H}^+$ ) 1-isomer  $\delta$  ( $\text{CDCl}_3$ )  $2.50$  (3H, s),  $4.22$  (3H, s),  $4.22$  (3H, s),  $7.23$  (1H, s),  $7.64$  (1H, dd,  $J = 8.3$  and  $1.5\text{Hz}$ ),  $8.03$  (1H, d,  $J = 8.4\text{Hz}$ ),  $8.12$  (1H, d,  $J = 1.6\text{Hz}$ ).  $m/z$  ( $\text{CI}^+, \text{NH}_3$ )  $231$  ( $\text{M}+\text{H}^+$ ),  $202$ ,  $172$ .

### Step 6

#### 3-Cyanomethyl-5-(2-methyltetrazol-5-yl) benzo[b]thiophene

10

To a refluxing mixture of 3-methyl-5-(2-methyltetrazol-5-yl) benzo[b]thiophene ( $0.162\text{g}$ ,  $0.703\text{mmol}$ ) and benzoyl peroxide ( $10.6\text{mg}$ ) in carbon tetrachloride ( $10\text{ml}$ ) irradiated with two desk lamps ( $2 \times 60\text{W}$ ) was added N-bromosuccinimide ( $0.126\text{g}$ ,  $0.707\text{mmol}$ ) in small portions. After the addition was complete the mixture was heated at reflux for a further  $90\text{ min}$ , then filtered and the filtrate was evaporated *in vacuo* to leave an oil/solid mixture. Chromatography on flash silica, eluting with dichloromethane gave  $0.161\text{g}$  of crude 3-bromomethyl-5-(2-methyltetrazol-5-yl) benzo[b]thiophene as a colourless oil.

15

20

The crude 3-bromomethyl-5-(2-methyl-tetrazol-5-yl) benzo[b]thiophene ( $0.145\text{g}$ ) in DMSO ( $0.3\text{ml}$ ) was added to a mixture of sodium cyanide ( $29.9\text{mg}$ ,  $0.61\text{mmol}$ ) in DMSO ( $0.2\text{ml}$ )

and the mixture was stirred at 100°C for 2h. After cooling, the mixture was poured into water (10ml) and a brown solid was filtered off, washed with water and dried in a vacuum pistol to leave 73.5mg. The filtrate was extracted with dichloromethane (3 x 30ml) and the combined extracts were dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated *in vacuo* to leave 44.7mg. This was combined with the original solid and chromatographed on flash silica, eluting with 20-50% ethyl acetate/petroleum ether to yield 61.5mg (38%) of the title product as a white solid.  $\delta$  (CDCl<sub>3</sub>) 3.99 (2H, s), 4.43 (3H, s), 7.59 (1H, s), 8.00 (1H, d, J = 8.5Hz), 8.19 (1H, dd, J = 8.5 and 1.5Hz), 8.47 (1H, s).

#### Step 7

After cooling in an ice-bath the mixture was quenched with 2N HCl (22ml) and heated to reflux for 1h. The THF was then removed *in vacuo* and the residue basified with 50% sodium hydroxide solution (4ml) before extracting with dichloromethane (3 x 75ml). The combined extracts were dried (K<sub>2</sub>CO<sub>3</sub>) and evaporated *in vacuo* to leave 0.45g.

Chromatography on flash silica eluting with  $\text{CH}_2\text{Cl}_2/\text{MeOH}/\text{NH}_3(\text{aq})$  (60:8:1) gave 0.383g (87%) of the title product as a white solid. The oxalate salt was prepared using oxalic acid in methanol/ether to give the title product oxalate as a white solid, m.p. 204-209°C. Analysis found: C, 47.75; H, 4.28; N, 19.28%. Calcd for  $\text{C}_{12}\text{H}_{13}\text{N}_5\text{S} \cdot 1.1 \text{ C}_2\text{H}_2\text{O}_4$ : C, 47.59; H, 4.28; N, 19.54%.  $\delta$  (DMSO) 3.17-3.21 (4H, m), 4.46 (3H, s), 7.72 (1H, s), 8.06 (1H, dd,  $J = 8.4$  and  $1.4\text{Hz}$ ), 8.52 (1H, s)  $m/z$  ( $\text{Cl}^+, \text{NH}_3$ ) 260 ( $\text{M}+\text{H}$ )<sup>+</sup>, 230.

### **CHARTER MARK 1993**

The Patent Office submitted an application in June for this year's Charter Mark awards. The names of the winners are announced today and I am delighted to inform you that the Patent Office is one of the organisations to be awarded a Charter Mark.

I am sorry that I have been unable to inform you of this news until now but there has been an embargo on the announcement.

The award will be presented today at the Charter Mark Winners' Conference to be held at the Queen Elizabeth II Conference Centre in London.

This award reflects the determined efforts of all staff in the Office to demonstrate that a 'regulator' can rise to the challenge of the Citizen's Charter by focusing on the needs of the customer and seeking to meet their legitimate expectations.

In every part of the Office customer service standards have been set and strengthened. The sum of these incremental improvements formed the basis of our application, and I am delighted that our efforts have been recognised in this way.

The Minister with responsibility for the Patent Office, Patrick McLoughlin, and the Permanent Secretary, Sir Peter Gregson, have asked me to pass on their congratulations and their thanks for the contribution made by staff throughout the organisation.

Well done!
